

5-3 コンクリート縁応力度

(上縁)

$$\begin{aligned} \sigma_u &= \frac{k \cdot p}{A_c} - \frac{k \cdot p \times e}{Z_u} + \frac{M}{Z_u} \\ &= \frac{39936_{\text{kg}}}{729_{\text{cm}^2}} - \frac{39936_{\text{kg}} \times 1.95_{\text{cm}}}{1538_{\text{cm}^3}} + \frac{1.073_{\text{t} \cdot \text{m}}}{1538_{\text{cm}^3}} = 73.9_{\text{kg/cm}^2} < f_c = 133.3_{\text{kg/cm}^2} \end{aligned}$$

(下縁)

$$\begin{aligned} \sigma_d &= \frac{k \cdot p}{A_c} - \frac{k \cdot p \times e}{Z_d} + \frac{M}{Z_d} \\ &= \frac{39936_{\text{kg}}}{729_{\text{cm}^2}} - \frac{39936_{\text{kg}} \times 1.95_{\text{cm}}}{1545_{\text{cm}^3}} + \frac{1.073_{\text{t} \cdot \text{m}}}{1545_{\text{cm}^3}} = 73.8_{\text{kg/cm}^2} > f_t = 0_{\text{kg/cm}^2} \end{aligned}$$

5-4 コンクリート斜張応力度

$$\sigma_s = \frac{S \times Q}{I \times b} = \frac{1077_{\text{cm}^3} \times 1.115_{\text{t}}}{7706_{\text{cm}^4} \times 40.8_{\text{cm}}} = 3.8_{\text{kg/cm}^2} < f_s = 9.3_{\text{kg/cm}^2} \quad \text{OK}$$

6. 部材の曲げひび割れ耐力の検討

曲げひび割れは、コンクリートの下縁応力が次の値に達した時、発生するものとする。

$$\begin{aligned} M_{cr} &= \left(\frac{k \cdot p}{A_c} + \frac{k \cdot p \times e}{Z_d} + \frac{5}{3} \times F_c \times \right) \times t_b \\ &= \left(\frac{39936_{\text{kg}}}{729_{\text{cm}^2}} + \frac{39936_{\text{kg}} \times 1.95_{\text{cm}}}{1545_{\text{cm}^3}} + \frac{5}{3} \times 400_{\text{kg/cm}^2} \times 0.07 \right) \times 1545_{\text{cm}^3} = 2.346_{\text{t} \cdot \text{m}} \end{aligned}$$

$$\text{安全率} \quad F_{cr} = \frac{M_{cr}}{M} = \frac{2.346_{\text{t} \cdot \text{m}}}{1.073_{\text{t} \cdot \text{m}}} = 2.2 > 1.3 \quad \text{OK}$$
